

What Parallel Snap Lock?

The first thing is to select the edge that is to be used - for this the "**Model Endpoint**" or "**Midpoint**" locks must be set - you then select this edge by moving to the point and pressing the **SHIFT** key (without pressing any mouse keys):

When you now move the cursor, the parallel highlight colour (yellow) will show when the edge is parallel to the selected:

You can then reselect the edge by repeating the above, and continue digitizing as required:
